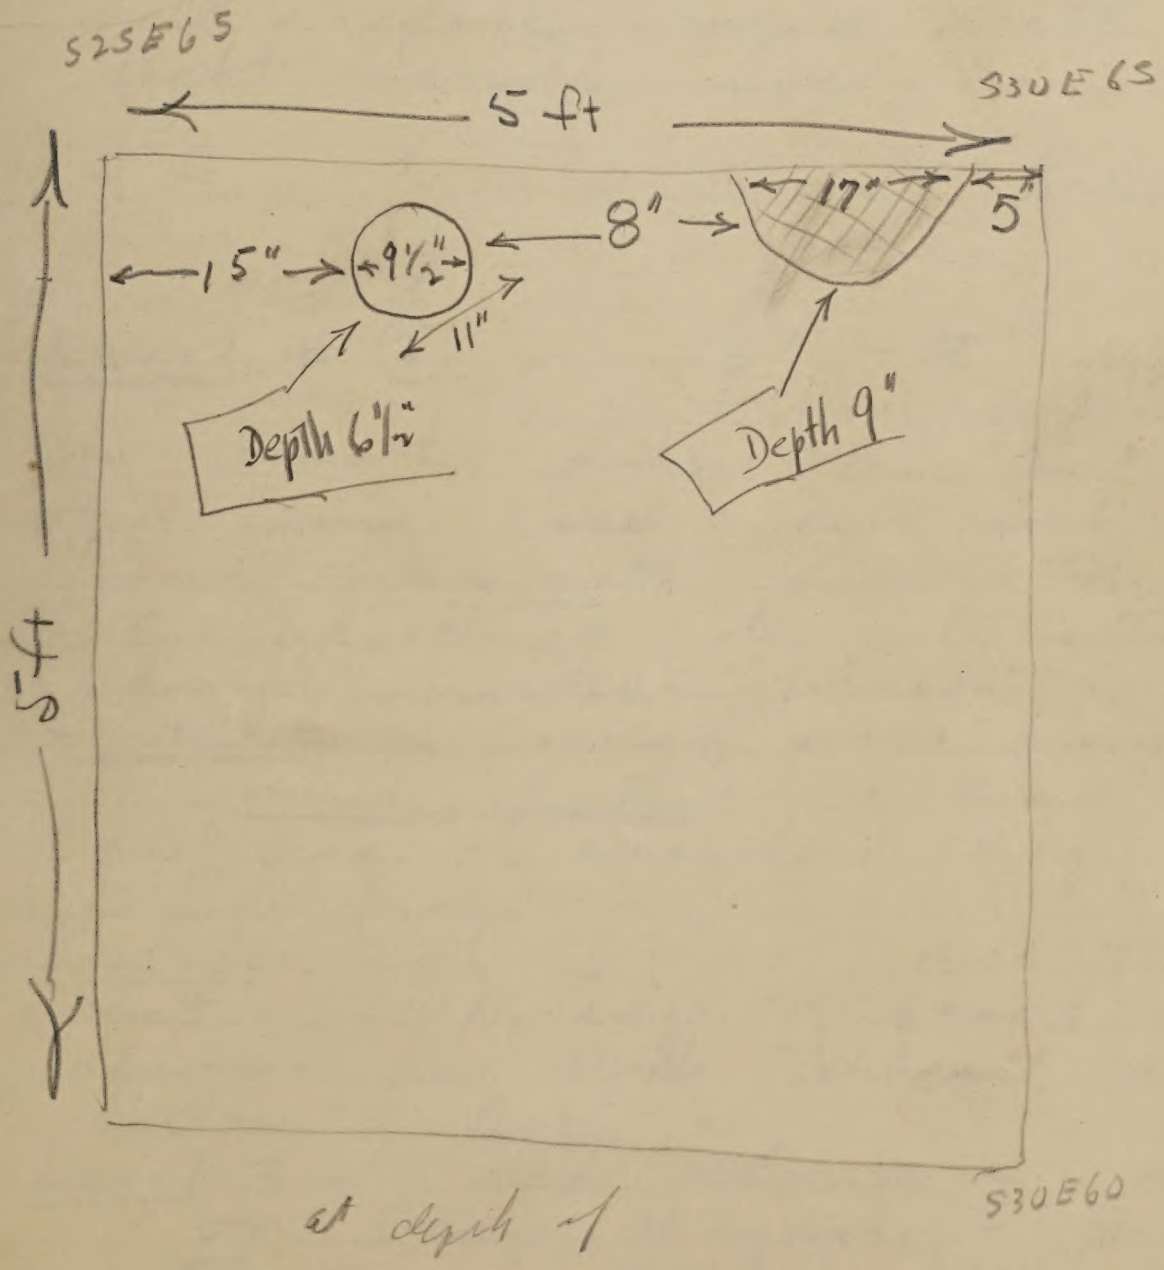
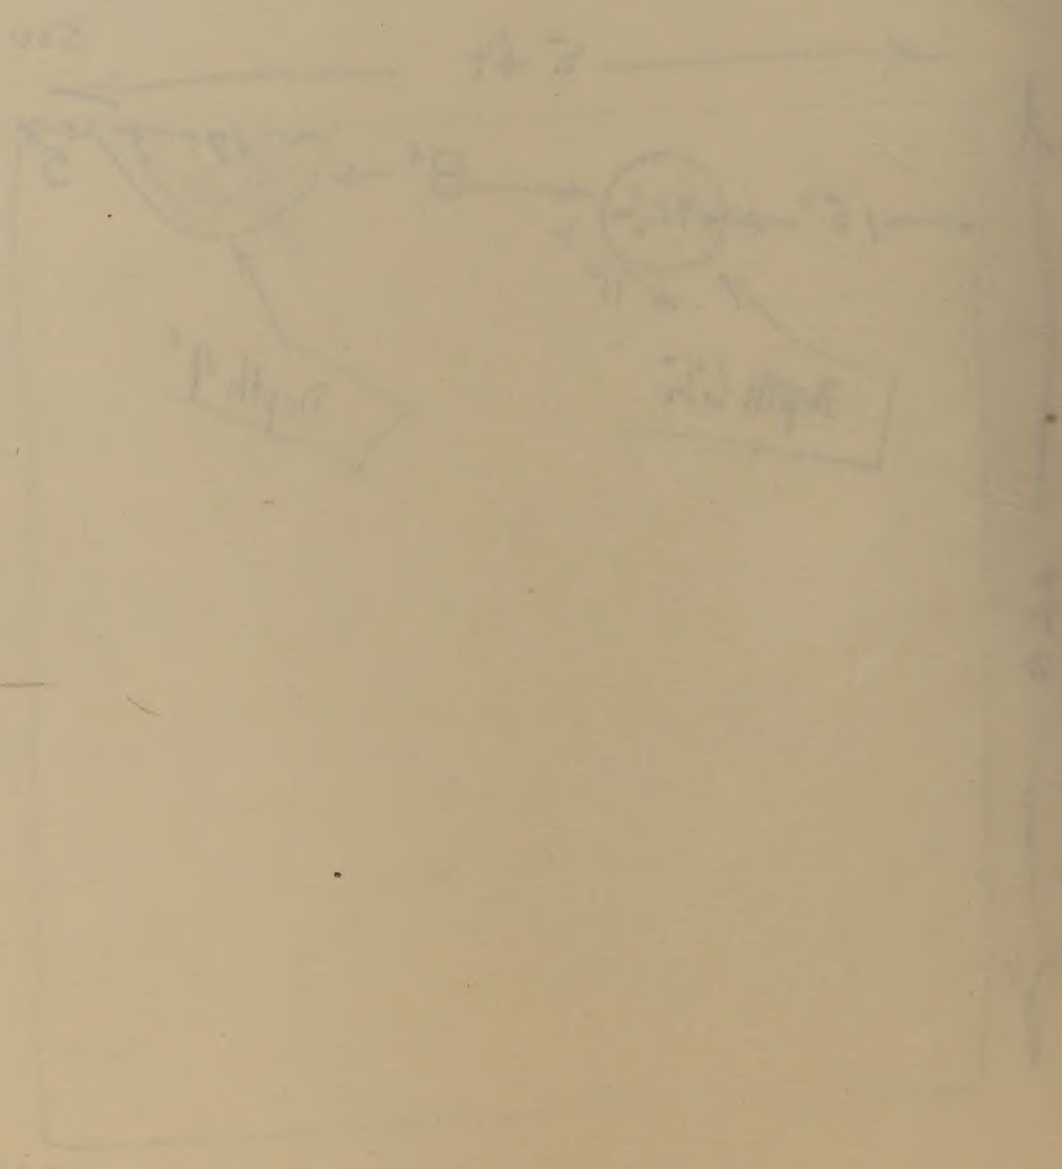
Box 26 Folder 24

SQUARE S30E65



at depth 1



15/4/50 WDB

Square E230/520

Level #I Top → 3" deep

Soil — Disturbed by cultivation — ash + refuse mixed with light sandy soil.

Artifacts — Bone bead — several potsherds

Features — nil.

Level #② — 3" — 9" deep (from surface)

soil — somewhat darker than level I — in some cases black soil found underneath sand — due to upsettage by cultivation plough marks visible

— artifacts — much more numerous — much pottery — a bead — awl frag. — arrowhead frag. 2 pipe frags.

Features — ? ? — ash thins out on N. edge of square — becoming pure sterile subsoil at bottom of level 2

Level 3 — ash thinner — only on S edge of square — few artifacts. pit visible in S/E corner of square — nearly 2' deep very few artifacts in it (pottery) — no corn etc. Also small pit? in NE corner — unproductive ± 1' deep

S25 E230

In this square there was at first a 4 to 6 inch level of plow-mottled loam, dark and mixed, when in a few spots were small lenses of charcoal-stained. Below this in all parts of the square was sand. However, in the southeast corner of the square the sand was only 2 inches thick and below it was a 1 inch to ½ of an inch refuse layer. 6 postholes extended down from it. In excavating thirds from the lower refuse layer were stacked in level 3 layers
